

# **TCPWave DDI – Messaging Apps Subscriptions for Alerts**

## Introduction

The network infrastructure services such as Domain Name Service, Dynamic Host Configuration Protocol, and IP Address Management, collectively called DDI, are essential in maintaining the applications' integrity, connectivity, and availability. Centralized fault management is necessary to scan these services, detect, analyze and provide a solution to any network issues. Therefore, fault management is an invaluable resource for the network administrators' teams to find and fix the network issues.

### **Fault Management**

TCPWave's Fault Management helps you identify, avoid and resolve the outages that endanger the application performance. An alert notifies the administrators that a key health or performance indicator has exceeded its set threshold. This real-time notification allows the administrators to detect, diagnose, and resolve any associated issues quickly.

#### **Alarm Subscriptions**

TCPWave IPAM Alarm Subscriptions allow to get notified about the critical or warning alerts based on the monitoring service category and component (DNS, DHCP, IPAM, Network, etc.) through the following messaging platforms when any of the metrics crosses a threshold.

- Email
- Google Chat
- Microsoft Teams
- Pager Duty
- Slack
- Telegram

#### **Adding Subscription**

The administrators can perform the following through the alarm subscriptions:

- Send one notification to multiple subscriptions.
- Send multiple notifications to individual subscriptions.

To add a subscription:

- Navigate to Infrastructure Management >> Fault Management >>Alarm Subscriptions.
- Click Add. The Add Subscription pop-up appears.
- Select the Organization, Alarm Criticality, Category, Component, and Threshold from the respective drop-downs.
- Based on the selected messaging platform, the system displays different fields as shown.

Add Subscription		Add Subscription	
Alerting properties Organization*	Alarm Criticality*	Alerting properties Organization*	Alarm Criticality*
Category*	Threshold*	• Category*	Threshold*
Component*		• Component*	
Messaging properties Messaging apps*		Messaging properties	
O E-mail O Google Chat	Subscription Name*	Messaging apps* O E-mail	Subscription Name*
Microsoft Teams     Pager Duty	Tokao*	Google Chat     Microsoft Teams	Integration Key*
Stack	Chat ID*	<ul> <li>Pager Duty</li> <li>Slack</li> </ul>	
		O Telegram	

Platform	Fields
Email	Contact
Google Chat	Subscription Name Webhook URL
Microsoft Teams	Subscription Name Webhook URL
Pager Duty	Subscription Name Webhook URL
Slack	Subscription Name Token Channel ID Webhook URL
Telegram	Subscription Name Token Chat ID

• Click OK. The system sends the notifications to the selected messaging platform.

**Note**: Once the network administrators fix the critical/warning alerts that are notified, the system notifies a matching OK alert.

# Conclusion

Identify, diagnose and resolve the issues before impacting your business applications with TCPWave's Fault Management platform. For a quick demo, contact the <u>TCPWave Sales Team</u>.
